

Recall: If A is a 2×2 matrix then it defines a linear transformation

$$T_A: \mathbb{R}^2 \rightarrow \mathbb{R}^2 \quad T_A(v) = Av$$

Note. T_A maps parallelograms to parallelograms:

Theorem

If A is a 2×2 matrix and $v_1, v_2 \in \mathbb{R}^2$ then

$$\text{area}(T_A(v_1), T_A(v_2)) = |\det A| \cdot \text{area}(v_1, v_2)$$

Generalization:

Theorem

If A is a 2×2 matrix then for any region S of \mathbb{R}^2 we have:

$$\text{area}(T_A(S)) = |\det A| \cdot \text{area}(S)$$

Idea of the proof.

The area of S can be approximated by the sum of small squares covering S .
