# Recall:

If  $A = [v_1 \dots v_n]$  is an  $m \times n$  matrix then:

- 1)  $Col(A) = Span(v_1, \ldots, v_n)$
- 2)  $\operatorname{Nul}(A) = \{ \mathbf{v} \in \mathbb{R}^n \mid A\mathbf{v} = \mathbf{0} \}$

### Construction of a basis of Col(A)

#### Lemma

Let V be a vector space, and let  $\mathbf{v}_1, \dots, \mathbf{v}_p \in V$ . If a vector  $\mathbf{v}_i$  is a linear combination of the other vectors then

$$\mathsf{Span}(\mathsf{v}_1,\ldots,\mathsf{v}_p)=\mathsf{Span}(\mathsf{v}_1,\ldots,\mathsf{v}_{i-1},\mathsf{v}_{i+1},\ldots,\mathsf{v}_p)$$

**Upshot.** One can construct a basis of a vector space V as follows:

- Start with a set of vectors  $\{v_1, \ldots, v_p\}$  such that  $Span(v_1, \ldots, v_p) = V$ .
- Keep removing vectors without changing the span, until you get a linearly independent set.

**Example.** Find a basis of Col(A) where A is the following matrix:

$$A = \begin{bmatrix} 1 & 0 & 2 & 0 & 1 & 0 \\ 0 & 1 & 3 & 0 & -1 & 0 \\ 0 & 0 & 0 & 1 & 3 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

**Example.** Find a basis of Col(A) where A is the following matrix:

$$A = \begin{bmatrix} -3 & 6 & -1 & 1 & -7 \\ 1 & -2 & 2 & 3 & -1 \\ 2 & -4 & 5 & 8 & -4 \end{bmatrix}$$

# Construction of a basis of Nul(A)

**Example.** Find a basis of Nul(A) where A is the following matrix:

$$A = \begin{bmatrix} -3 & 6 & -1 & 1 & -7 \\ 1 & -2 & 2 & 3 & -1 \\ 2 & -4 & 5 & 8 & -4 \end{bmatrix}$$

### **Upshot.** If *A* is matrix then:

 $\dim \operatorname{Col}(A) = \operatorname{the number of pivot columns of } A$ 

 $\dim \text{Nul}(A) = \text{the number of non-pivot columns of } A$ 

### **Definition**

If *A* is a matrix then:

- ullet the dimension of  $\operatorname{Col}(A)$  is called the  $\operatorname{rank}$  of A and it is denoted  $\operatorname{rank}(A)$
- the dimension of Nul(A) is called the *nullity* of A.

#### The Rank Theorem

If A is an  $m \times n$  matrix then

$$rank(A) + \dim Nul(A) = n$$

**Example.** Let A be a  $100 \times 101$  matrix such that  $\dim \operatorname{Nul}(A) = 1$ . Show that the equation  $A\mathbf{x} = \mathbf{b}$  has a solution for each  $\mathbf{b} \in \mathbb{R}^{100}$ .

**Example.** Let A be a  $5 \times 9$ . Can the null space of A have dimension 3?
