MTH 309T Practice Exam 3

1. Consider the following vectors in \mathbb{R}^4 :

$$\mathbf{v}_1 = \begin{bmatrix} 1 \\ 0 \\ -1 \\ 1 \end{bmatrix}, \quad \mathbf{v}_2 = \begin{bmatrix} 2 \\ 1 \\ -1 \\ 0 \end{bmatrix}, \quad \mathbf{v}_3 = \begin{bmatrix} 2 \\ -2 \\ -1 \\ 3 \end{bmatrix}, \quad \mathbf{u} = \begin{bmatrix} 3 \\ 3 \\ 3 \\ 3 \end{bmatrix}$$

The set $\mathcal{B} = \{v_1, v_2, v_3\}$ is a basis of some subspace V of \mathbb{R}^4 .

- a) Find an orthogonal basis $\mathfrak{D} = \{\mathbf{w}_1, \mathbf{w}_2, \mathbf{w}_3\}$ of the subspace V.
- **b)** Compute the vector $\operatorname{proj}_{V} \mathbf{u}$, the orthogonal projection of \mathbf{u} onto V.
- **2.** Find the equation f(x) = ax + b of the least square line for the points (1,0), (-1,2), (2,1).
- **3.** Consider the following matrix A:

$$A = \left[\begin{array}{rrr} 0 & 1 & 2 \\ 1 & 1 & 0 \\ 4 & 2 & 2 \end{array} \right]$$

For each value of λ given below determine if it is an eigenvalue of A.

a)
$$\lambda = 0$$

b)
$$\lambda = -1$$

c)
$$\lambda = -2$$

4. Consider the matrix

$$A = \begin{bmatrix} 1 & 8 & 4 \\ -2 & 11 & 4 \\ 2 & -8 & -1 \end{bmatrix}$$

Knowing that eigenvalues of A are $\lambda_1=3$ and $\lambda_2=5$ diagonalize this matrix; that is, find a diagonal matrix D and an invertible matrix P such that

$$A = PDP^{-1}$$

Note: you do not need to compute P^{-1} .

- 5. For each of the statements given below decide if it is true or false. If it is true explain why. If it is false give a counterexample.
- a) If u,v are vectors in \mathbb{R}^2 which satisfy ||u+v||=u-v then u must be orthogonal to v.
- **b)** If A is a 3×3 matrix which is both symmetric and orthogonal then $A^3 = A$.
- c) If A is an $n \times n$ matrix and v is eigenvector of A, then v is also an eigenvector of A^2 .
- d) If A is an $n \times n$ matrix and λ is eigenvalue of A, then λ is also an eigenvalue of A^2 .
